

# The `fixdif` Package

Zhang Tingxuan

2022/7/19 Version 1.3a\*

## Abstract

The `fixdif` package redefines the `\d` command in  $\text{\LaTeX}$  and provides an interface to define commands for differential operators.

The package is compatible with `pdf $\text{\TeX}$` , `X $\text{\TeX}$`  and `Lua $\text{\TeX}$` . Furthermore, the package is compatible with `unicode-math` package in `X $\text{\TeX}$`  and `Lua $\text{\TeX}$` .

## 1 The background

It’s usually recommended that one should reserve a small skip between the differential operator and the expression before it<sup>1</sup>. Take the following cases as an example:

$$f(x)dx \quad \text{and} \quad f(x) \, dx.$$

We usually consider that the example on the right side is better than the one on the left side. The little skip between  $f(x)$  and  $dx$  can be regarded as a symbol of the product of  $f(x)$  and  $dx$ .

So some users prefer to define a macro like this:

```
\renewcommand\d{\mathop{\mathrm{d}}\!{}}
```

This macro works well in “display math” and “text math”, but we still face the following three problems:

1. The skip before “d” would still be reserved in “text fraction”, which is regarded bad. For example, `\d y/\d x` produces  $dy/dx$ ;
2. This `\d` command cannot be used out of math mode. In another word, `\d{o}` would not produce “o” in text;
3. The skip between “d” and the expression before it can be regarded as a product operator. A product operator is definitely a binary operator.

Take `\cdot` ( $\cdot$ ) as an example. A binary operator reserves small skips before and after itself when in “display math” or “text math” such as  $x \cdot y$ , but the skips will disappear in “script math” or “script script math” such as  $a^{x \cdot y}$ . Thus the small skip should also disappear in script, but `\a^{f(x)\d x}` still produces  $a^{f(x) \, dx}$  but not  $a^{f(x)dx}$ .

To solve these problems, you can try this package.

---

<sup>1</sup>See <https://tex.stackexchange.com/questions/14821/whats-the-proper-way-to-typeset-a-differential-operator>.

## 2 Introduction

To load this package, write

```
\usepackage{fixdif}
```

in the preamble. In your document,

```
\[ f(x)\d x,\quad\frac{\d y}{\d x},\quad\d y/\d x,\quad a^{\d y\d x}. \]
```

will produce

$$f(x) \, dx, \quad \frac{dy}{dx}, \quad dy/dx, \quad a^{y \, dx}.$$

### 2.1 When using unicode-math

If you are using `unicode-math` package with X<sub>Y</sub>TeX/LuaTeX in your document, you must pay attention to the following items:

- If you want to use `amsmath` package, make sure that the `unicode-math` package is loaded *after* `amsmath`.
- You had better specify the math font through the `\setmathfont` command provided by `unicode-math` in order to avoid bad skip in text fraction like  $dy/dx$ .
- Load the `fixdif` package *after* `unicode-math`.

Therefore the correct order is

```
\usepackage{amsmath}
\usepackage{unicode-math}
\setmathfont{...}[...]
\usepackage{fixdif}
```

### 2.2 When using hyperref

If you want to use the `hyperref` package simultaneously, remember to load `hyperref` *before* the `fixdif` package, otherwise the `hyperref` package will cause conflicts.

### 2.3 Basic commands and package options

`\d` The `fixdif` package provides a `\d` command for the differential operator “d” in math mode. When in text, `\d` behaves just like the old `\d` command in L<sup>A</sup>T<sub>E</sub>X or plain T<sub>E</sub>X as an accent command. For example,

```
 $\$ \d x \$$  and  $\d x$ 
```

will produce “ $dx$  and  $\dot{x}$ ”.

**Set the font of `\d`** There are two basic package options to control the `\d`'s style in math mode — `rm` and `normal`. The default option is `rm`, in which case `$f(x)\d x$` produces  $f(x) dx$ . If you chose the `normal` option, for example

```
\usepackage[normal]{fixdif}
```

`$f(x)\d x$` would produces  $f(x) dx$ .

**`\resetdfont`** Besides the previous two optional fonts, you can reset the font of differential operator “d” through `\resetdfont` command in preamble:

```
\resetdfont{\mathsf}
```

then `\d x` will produce  $dx$ .

**`\partial`** **Control the behavior of `\partial`** In default, `\partial` will also be regarded as a differential operator in this package. If you don't like this default setting, you can use the `nopartial` option:

```
\usepackage[nopartial]{fixdif}
```

## 3 Define commands for differential operators

*Attention! The commands in this section can be used in preamble only!*

### 3.1 Define commands with a single command name

**`\letdif`** `\letdif{<cmd>}{<cname>}` (preamble only)

The `\letdif` command has two arguments — the first is the newly-defined command and the second is the control sequence *name* of a math character, that is, a command without its backslash. For example,

```
\letdif{\vr}{delta}
```

then `\vr` will produce a  $\delta$  (`\delta`) with automatic skip before it.

Through the `\letdif` command, we can redefine a math character command by its name. For example,

```
\letdif{\delta}{delta}
```

then `\delta` itself will be a differential operator.

The second argument `<cname>` of `\letdif` command can be used repeatedly.

**`\letdif*`** `\letdif*{<cmd>}{<cname>}` (preamble only)

This command is basically the same as `\letdif`, but this command will patch a correction after the differential operator. This is very useful when a math font is setted through `unicode-math` package. For example,

```

\usepackage{unicode-math}
\setmathfont{TeX Gyre Termes Math}
\usepackage{fixdif}
\letdif{\vr}{updelta}

```

this will cause bad negative skip after `\vr`, but if you change the last line into

```
\letdif*{\vr}{updelta}
```

you will get the result correct.

### 3.2 Define commands with multi commands or a string

```

\newdif \newdif{<cmd>}{<multi-cmd>}          (without correction, preamble only)
\newdif* \newdif*{<cmd>}{<multi-cmd>}        (with correction, preamble only)

```

The first argument of these commands is the newly-defined command; and the second argument should contain *more than one* tokens. For example, if you have loaded the `xcolor` package, you can use the following line:

```
\newdif{\redsf}{\textsf{\color{red}d}}
```

Then you get the `\redsf` as a differential operator. Take another example,

```
\newdif{\D}{\mathrm{D}}
```

Then you get `\D` for an uppercase upright “D” as a differential operator.

If your second argument contains only one command like `\Delta`, it’s recommended to use `\letdif` or `\letdif*` instead.

`\newdif` and `\newdif*` will check whether `<cmd>` has been defined already. If so, an error message will be given.

```

\renewdif \renewdif{<cmd>}{<multi-cmd>}      (without correction, preamble only)
\renewdif* \renewdif*{<cmd>}{<multi-cmd>}    (with correction, preamble only)

```

These two commands are basically the same as `\newdif` and `\newdif*`. The only difference is that `\renewdif` and `\renewdif*` will check whether `<cmd>` has *not* been defined yet. If so, an error message will be given.

## 4 Using differential operators temporarily

```

\mathdif \mathdif{<symbol>}                  (without correction, in math mode only)
\mathdif* \mathdif*{<symbol>}                 (with correction, in math mode only)

```

These two commands can be used in math mode only, more specifically, after `\begin{document}`. For example, `$x\mathdif{\Delta}\psi$` will get  $x\Delta\psi$ .

## 5 Examples

This section shows how to use this package properly in your document.

Take the two examples below:

```
\letdif{\Delta}{Delta}      % Example 1, in preamble
\letdif{\nabla}{nabla}     % Example 2, in preamble
```

Actually, the second example is more reasonable. Sometimes, we take “ $\Delta$ ” as laplacian (equivalent to  $\nabla^2$ ), while “ $\Delta$ ” can also be regarded as a variable or function at some other times. Consequently, it’s better to save a different command for “ $\Delta$ ” as laplacian while reserve `\Delta` as a command for an ordinary math symbol “ $\Delta$ ”. However, in the vast majority of cases, “ $\nabla$ ” is regarded as nabla operator so there is no need to save a different command for “ $\nabla$ ”. Then we can correct the code above:

```
\letdif{\laplacian}{Delta}  % Example 1, corrected, in preamble
```

With the `xparse` package, we can define the command in another method:

```
\letdif{\nabla}{nabla}
\DeclareDocumentCommand{ \laplacian }{ s }{
  \IfBooleanTF{#1}{\mathdif{\Delta}}{\nabla^2}
}
```

Then `\laplacian` produces  $\nabla^2$  and `\laplacian*` produces  $\Delta$ .

**Dealing with “+” and “−”** If you input `-$-\mathrm{d} x$`, you’ll get “ $-\mathrm{d}x$ ” in your document. However, if you think “ $-dx$ ” is better, you can input `-\mathrm{d} x`. The “ $\mathrm{d} x$ ” in a *group* will be regarded *ordinary* but not *inner* so that the small skip will disappear. Maybe “ $-dx$ ” is just okay.

## 6 The source code

```
1 <*package>
```

Check the  $\mathrm{T}_{\mathrm{E}}\mathrm{X}$  format and provides the package name.

```
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{fixdif}[2022/7/19 Interface for defining differential operators.]
```

### 6.1 Control the skip between slashes and differential operator

Change the math code of slash (/) and backslash (\) so that the skip between slashes and differential operators can be ignored.

```
4 \@ifpackageloaded{unicode-math}{
```

If the `unicode-math` package has been loaded, use the  $\TeX$ /Lua $\TeX$  primitive `\Umathcode` to change the type of slashes. The numeral “4” stands for “open”.

```

5 \Umathcode'\ /= "4 "0 "002F
6 \Umathcode"2044="4 "0 "2044
7 \Umathcode"2215="4 "0 "2215
8 \Umathcode"2F98="4 "0 "2F98
9 \Umathcode'\ = "4 "0 "005C
10 \Umathcode"2216="4 "0 "2216
11 \Umathcode"29F5="4 "0 "29F5
12 \Umathcode"29F9="4 "0 "29F9
13 }{

```

If the `unicode-math` package has not been loaded, use the  $\TeX$  primitive `\mathcode` to change the type of slashes. The `\backslash` needs to be redefined through `\delimiter` primitive too.

```

14 \mathcode'\ /= "413D
15 \mathcode'\ = "426E % \backslash
16 \def\backslash{\delimiter"426E30F\relax}
17 }

```

## 6.2 Patch the skips around the differential operator

`\mup@tch` The following `\mup@tch` patches the skip after the differential operator.

```
18 \def\mup@tch{\mathchoice{\mskip-\thinmuskip}{\mskip-\thinmuskip}{\mskip-\thinmuskip}{\mskip-\thinmuskip}}
```

The `\s@beforep@tch` patches the commands with star (`\letdif*`, etc).

```
19 \def\s@beforep@tch{\mathchoice{}{}{\mbox{}}{\mbox{}}}
```

## 6.3 Declare the package options

Declare the options of the package and execute them.

```

20 \DeclareOption{rm}{\@ifpackageloaded{unicode-math}
21   {\def\@@dif{\symrm{d}}}{\def\@@dif{\mathrm{d}}}}
22 \DeclareOption{normal}{\def\@@dif{d}}
23 \DeclareOption{partial}{\def\fixdif@partial@bool{1}}
24 \DeclareOption{nopartial}{\def\fixdif@partial@bool{0}}
25 \ExecuteOptions{rm,partial}
26 \ProcessOptions\relax

```

Control the behavior of `\partial`.

```

27 \def\fixdif@partial@true{1}
28 \ifx\fixdif@partial@bool\fixdif@partial@true
29   \AtEndOfPackage{\letdif\partial\partial}
30 \fi

```

`\resetdfont` Define the `\resetdfont` command.

```

31 \gdef\resetdfont#1{\let\@@dif\relax%
32   \def\@@dif{#1{d}}}

```

## 6.4 Deal with the `\d` command

`\@dif` `\@dif` is the differential operator produced by `\d` in math mode. Here we prefer `\mathinner` to `\mathbin` to make the skip.

```
33 \def\@dif{\mathinner{\@\@dif}\mup@tch}
```

`\d@accent` Restore the `\d` command in text by `\d@accent` with the `\let` primitive.

```
34 \let\d@accent\d
```

`\d` Redefine the `\d` command. In text, we need to expand the stuffs after `\d`

```
35 \DeclareRobustCommand\d{\ifmode\@dif\else\expandafter\d@accent\fi}
```

## 6.5 User's interface for defining new differential operators

`\letdif` Define the `\letdif` and `\letdif*` command. The internal version of `\letdif` is `\letdif*` `\@letdif`, of `\letdif*` is `\s@letdif`.

```
36 \def\@letdif#1#2{\AtBeginDocument{%
```

`#1` is the final command; `#2` is the “control sequence name” of `#1`'s initial definition. Here we create a command (`\csname#2@old\endcsname`) to restore `#2`.

```
37 \ifcsname #2@old\endcsname\else%
38 \expandafter\let\csname #2@old\endcsname
39 \csname #2\endcsname%
40 \fi%
```

Finally let `#1` be the new command.

```
41 \gdef#1{\mathinner{\csname #2@old\endcsname}\mup@tch}%
42 }}
```

The definition of `\s@letdif` is similar, but with the patch for negative skips.

```
43 \def\s@letdif#1#2{\AtBeginDocument{%
44 \ifcsname #2@old\endcsname\else%
45 \expandafter\let\csname #2@old\endcsname
46 \csname #2\endcsname%
47 \fi%
48 \gdef#1{\mathinner{\s@beforep@tch\csname #2@old\endcsname\mbox{}}}\mup@tch}%
49 }}
50 \def\letdif{\@ifstar\s@letdif\@letdif}
```

`\newdif` Define the `\newdif` and `\newdif*` commands. `#1` is the final command; `#2` is the `\newdif*` “long” argument.

```
51 \long\def\@newdif#1#2{\AtBeginDocument{%
52 \ifdefined#1
53 \PackageError{fixdif}{\string#1 is already defined.}
54 {Try another command instead of \string#1.}%
55 \else
```

```

56     \long\gdef#1{\mathinner{#2}\mup@tch}%
57     \fi%
58 }}
59 \long\def\s@newdif#1#2{\AtBeginDocument{%
60     \ifdefined#1
61     \PackageError{fixdif}{\string#1 is already defined.}
62     {Try another command instead of \string#1.}%
63     \else
64     \long\gdef#1{\s@beforep@tch\mathinner{#2\mbox{}}}\mup@tch}%
65     \fi%
66 }}
67 \def\newdif{\@ifstar\s@newdif\@newdif}

\renewdif Define the \renewdif and \renewdif* commands.
\renewdif*
68 \long\def\@renewdif#1#2{\AtBeginDocument{%
69     \ifdefined#1
70     \long\gdef#1{\mathinner{#2}\mup@tch}%
71     \else
72     \PackageError{fixdif}{\string#1 has not been defined yet.}
73     {You should use \string\newdif instead of \string\renewdif.}%
74     \fi%
75 }}
76 \long\def\s@renewdif#1#2{\AtBeginDocument{%
77     \ifdefined#1
78     \long\gdef#1{\s@beforep@tch\mathinner{#2\mbox{}}}\mup@tch}%
79     \else
80     \PackageError{fixdif}{\string#1 has not been defined yet.}
81     {You should use \string\newdif instead of \string\renewdif.}%
82     \fi%
83 }}
84 \def\renewdif{\@ifstar\s@renewdif\@renewdif}

```

## 6.6 In-document commands: \mathdif and \mathdif\*

```

85 \def\@mathdif#1{\mathinner{#1}\mup@tch}
86 \def\s@mathdif#1{\s@beforep@tch\mathinner{#1\mbox{}}}\mup@tch}
87 \DeclareRobustCommand\mathdif{\@ifstar\s@mathdif\@mathdif}

```

End of the package.

```
88 \endpackage
```
